Deliver Exceptional Battery Life

For many years, the trend in the consumer electronics market has been to make an increasing number of devices integrated and portable. As a result, smartphones, "phablets," eBook readers, tablets, and smartwatches with multiple functions and features have emerged. Over the past few years, these devices have grown in size and power consumption. Aside from functionality and features, battery life has become the single most critical factor in product differentiation and customer satisfaction.

Only Keysight's N6780 Series SMUs let you visualize the current drain from nA to A in one pass and one picture, unlocking insights to deliver exceptional battery life.

Keysight Patented Feature: Seamless Dynamic Measurements

N6781A, N6782A, N6785A, and N6786A

Measuring static current accurately can be a challenge. Measuring dynamic currents from nA to A is an even greater challenge. Depending on the level of current, a different precision measurement resistor must be used, representing a measurement range in the power supply.

The N6781A, N6782A, N6785A, and N6786A have multiple current measurement ranges, making them tuned to measure the different operating states of a device: off-, sleep-, standby-, and transmit-mode. In addition, the top three ranges support a Keysight Technologies, Inc. exclusive feature called "seamless measurement ranging." When you enable this feature, as the current drawn by the device under test (DUT) changes, the SMU automatically and instantaneously detects which current measurement range will return the most precise measurement and changes to that range seamlessly. When combined with the SMU's built-in 18-bit digitizers, seamless measurement ranging enables unprecedented effective vertical resolution of ~28-bits. This provides unrivaled productivity gains and insights into power consumption never possible before. Only Keysight's N6780 Series SMUs let you visualize the current drain from nA to A in one pass and one picture, unlocking insights to deliver exceptional battery life.

Seamless measurement autoranging is available on models N6784A SMU with the SMR option.

Supplemental Characteristics

Note 1. When sinking power, the N6784A model can operate at the maximum rated output power for only a limited amount of time. The unit monitors the temperature of the internal power devices and latches the output off if the output power has exceeded its safe limits. A protect clear is required to resume normal operation. The condition is annunciated by the OT status bit. Refer to the down programmer derating figure for the values of the safe limit boundaries.

Unless otherwise noted, specifications are warranted over the ambient temperature range of 0 to 55 °C after a 30-minute warm-up period. Unless otherwise noted, specifications apply at the mainframe output terminals, with each module's sense terminals internally connected to its output terminals (local sensing).

For the setup conditions and verification/calibration, refer to the Keysight N6705B Service Guide (literature number N6705-90010) http://literature.cdn.keysight.com/litweb/pdf/N6705-90010.pdf.

Supplemental characteristics are not warranted but are descriptions of performance determined by design or type testing. All supplemental characteristics are typical unless otherwise noted.
