- *4: Signal and control ports interface cables length: Less than 3m, DC output power port cables length: Less than 30m.
- *5: Not including EMI filter inrush current, less than 0.2mS.
- *6: 85~132Vac or 170~265Vac. Constant load.
- *7: From No-Load to Full-Load, constant input voltage. Measured at the sensing point in Remote Sense.
- *8: Measured with JEITA RC-9131C (1:1) probe. At low temperature (0~10°C) power supply needs 2min warm up.
- *9: For load voltage change, equal to the unit voltage rating, constant input voltage.
- *10: The maximum voltage on the power supply terminals must not exceed the rated voltage.
- *11: From 10% to 90% of Rated Output Voltage, with rated, resistive load.
- *12: From 90% to 10% of Rated Output Voltage.
- *13: The ripple is measured at 10~100% of rated output voltage and rated output current. B.W 5Hz~1MHz.
- *14: The Constant Current programming, readback and monitoring accuracy do not include the warm-up and Load regulation thermal drift.
- *15: Measured at the sensing point.
- *16: Maximum ambient temperature for IEEE option is 40°C.
- *17: Tamb = 25°C, rated output power.
- *18: At Tamb < 10°C the Output Ripple & Noise is higher, there is a need of 2min warm-up.
 To achieve high-speed responded, the output capacitance has been reduced.
 Due to smaller capacitance, the output ripple & noise is higher, but it's not a problem for applications requiring high speed power supply as Automotive industry.

GENESYS™ 1.7kW/3.4kW models with a Power Sink Option (PSINK)
can absorb energy from the load.

Features

- Maintains output voltage setting regardless of whether output power is positive or negative (source and sink)
- Can absorb 300 W peak power
- Absorb 100W continues power
- The Power Sink module also allows for a faster response time when power supply is programmed to a lower output voltage.
- 5 year warranty

Applications

- Ideal solution for testing electric motors with PWM-speed control. These systems often return power to the power supply during braking conditions.
- ATE systems requiring fast down programming at no load conditions.
- Testing capacitors and batteries.
- Automotive Motor Test eg. power window drives, mirror and seat adjustment.

GENESYS™ with Power Sink Options

Source and Sink

Typical load current PWM – controlled DC motor

The Power Sink module absorbs power that is feedback to the unit.

Phase 1 – Power supply delivers the electrical energy and the motor transform this electrical energy to kinetic energy to the load. Motor is running in constant speed.

Phase 2 – Motor is braking, the excess kinetic energy from the load is returned to the power supply. This excess energy is charging the power supply output capacitance and rises the output voltage.

Phase 3 – Control circuit senses that output voltage is rising above the desired level and signals Power Sink to dissipate the excess energy in the form of heat.
