Definitions and Conditions

Specification (spec):

The specifications (called out as spec) in the following pages describe the warranted performance of a calibrated instrument for 23 ± 5 °C after a 30-minute warm-up period (unless otherwise stated). Specifications include guard-bands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions.

Nominal (nom):

Values indicate the expected mean or average performance, or a parameter whose performance is by design, such as the 50-ohm connector. This data is not warranted and is measured at room temperature (approximately 25 °C).
