Definitions

All specifications apply to the conditions of a 0 to 55°C temperature range, unless otherwise stated, and 30 minutes after the instrument has been turned on.

Specifications (spec.): Warranted performance. Specifications include guardbands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions.

Supplemental information is provided as information that is useful in operating the instrument but is not covered by the product warranty. This information is classified as either typical or nominal.

Typical (typ.): Expected performance of an average unit without taking guardbands into account.

Nominal (nom.): A general descriptive term that does not imply a level of performance.

How to Use Tables

When measurement conditions fall under multiple categories in a table, apply the best value.

For example, basic accuracy Ab is 0.10% under the following conditions:

Compensation function

Table 28. The E4980B/E4980BL provides three types of compensation functions: OPEN compensation, SHORT compensation, and LOAD compensation.

Type of compensation	Description
OPEN compensation	Compensates errors caused by the stray admittance (C, G) of the test fixture.
SHORT compensation	Compensates errors caused by the residual impedance (L, R) of the test fixture.
LOAD compensation	Compensates errors between the actual measured value and a known standard value under the measurement conditions desired by the user.

List sweep

Points: There is a maximum of 201 points.

First sweep parameter (primary parameter): Test frequency, test signal voltage, test signal current, test signal voltage of DC bias signal, test signal current of DC bias signal, DC source voltage.

Second sweep parameter (secondary parameter): None, impedance range, test frequency, test signal voltage, test signal current, test signal voltage of DC bias signal, test signal current of DC bias signal, DC source voltage.

Note:

- A parameter selected for one of the two parameters cannot be selected for the other parameter. It is not possible to set up a combination of test signal voltage and test signal current or one of test signal voltage of DC bias signal and test signal current of DC bias.
- The secondary parameter can be set only with SCPI commands.

Trigger mode

Sequential mode: When the E4980B/E4980BL is triggered once, the device is measured at all sweep points. /EOM/INDEX is output only once.

Step mode: The sweep point is incremented each time the E4980B/E4980BL is triggered. /EOM/INDEX is output at each point, but the result of the comparator function of the list sweep is available only after the last /EOM is output.

Comparator function of list sweep: The comparator function enables setting one pair of lower and upper limits for each measurement point.

You can select from: Judge with the first sweep parameter/Judge with the second parameter/Not used for each pair of limits.

Time stamp function: In the sequential mode, it is possible to record the measurement starting time at each measurement point by defining the time when FW detects a trigger as 0 and obtain it later with the SCPI command.

Comparator function

Bin sort: The primary parameter can be sorted into 9 BINs, OUT_OF_BINS, AUX_BIN, and LOW_C_REJECT. The secondary parameter can be sorted into HIGH, IN, and LOW. The sequential mode and tolerance mode can be selected as the sorting mode.

Limit setup: Absolute value, deviation value, and % deviation value can be used for setup.

BIN count: Countable from 0 to 999999.

When DC bias is applied to the DUT, add the following value to the absolute accuracy Ab.

Table 64. Only when Fm < 10 kHz and |Vdc| > 5 V

SHORT	MED, LONG
0.05% × (100 mV/Vs) × (1 + √(100/Fm))	0.01% × (100 mV/Vs) × (1 + √(100/Fm))

Fm [Hz]   Test frequency

Vs [V]   Test signal voltage

Relative measurement accuracy with bias current isolation

When DC bias Isolation is set to ON, add the following value to the open offset Yo.

Equation 20.   *Yo_DCI1 × (1 + 1/(Vs)) × (1 + √(500/Fm)) + Yo_DCI2*

Zm [Ω]   Impedance of DUT

Fm [Hz]   Test frequency

Vs [V]   Test signal voltage

Yo_DCI1,2 [S]   Calculate this by using Table 65 and 66

Idc [A]   DC bias isolation current

DC bias settling time

When DC bias is set to ON, add the following value to the settling time:

	Bias	Settling time
1	Standard	Capacitance of DUT × 100 × loge (2/1.8 m) + 3 m
2	Option 001	Capacitance of DUT × 100 × loge (40/1.8 m) + 3 m
