Operational Down to -40 °C Temperature

The U1273AX OLED handheld digital multimeter, the latest addition to U1270 Series, is capable of operating in winter weather down to –40 °C temperature. Even in frigid conditions, the U1273AX enables you to achieve immediate and accurate results without the need to warm up in advance.

OLED for More Display Clarity

Designed with OLED display, you can experience crystal-clear measurement readings with its outstanding 2000:1 contrast ratio. The display also allows wider viewing angles up to 160 degrees ensuring you get the right readings at the first glance even in poorly lit environments.

Key Functions

Water and dust resistance (IP54)

The series' tightly sealed design helps protect against water, dust and damage. Each handheld DMM is certified with IP 54 ratings so that you can carry out tests and measurements with confidence, even in harsh working conditions.

Operational up to 3000 meters altitude

For high altitude applications such as wind farm maintenance, you can measure with confidence using the U1270 Series, capable of measuring up to 3000 meters above sea level.

High measurement rate at seven readings per second for Voltage and Current

You can detect even the slightest change in your sensitive signals (Voltage and Current) with its high measurement rate capability. By clicking the resettable smooth function button, you may customize the readings' sensitivity suitable for various tests.

Visual alert for continuity test (for U1271A and U1272A only)

Continuity detection in noisy and dark environments is made easy with U1270 Series' loud beeper and flashing backlight that indicates continuity and thus improves safety.

Up to 10,000 recording points for manual, auto and event logging

Record measurements on-the-go and transfer data to PC conveniently with the huge internal memory of up to 10,000 recording points. The GUI Data Logging software and optional U1173A IR-USB cable are required to transfer data or perform real time data logging on a PC.

Built-in Low Pass Filter

The U1270 Series offers a 440 Hz LPF or Low Pass Filter to provide accurate output measurements. This function eliminates high-frequency noise and harmonics, ensuring motor filter efficiency.

Low impedance mode

Stray voltages are usually found in non-energized electrical wiring adjacent to powered wires due to capacitive or inductive coupling between these wires. The low impedance mode serves to eliminate false readings by dissipating these stray voltages thus improves safety and measurement efficiency during voltage measurement.

Peak detect at 250 µs

The peak detect function allows you to capture the engine or motor startup transient as fast as 250 µs.

2. The accuracy does not include the tolerance of the thermocouple probe.
3. Do not allow the temperature sensor to contact a surface that is energized above 30 Vrms or 60 V DC. Such voltages pose a shock hazard.

Frequency specifications [1, 2]

Range	Resolution	Accuracy ± (% of reading + counts of least significant digit)	Maximum input frequency
99.999 Hz	0.001 Hz	0.02 + 5	0.5 Hz
999.99 Hz	0.01 Hz	0.005 + 5	
9.9999 kHz	0.1 Hz	0.005 + 5	
99.999 kHz	1 Hz	0.005 + 5	
999.99 kHz	0.01 Hz	0.005 + 5	
> 1 MHz	0.1 Hz	0.005 + 5 @< 1 MHz	

1. Overload protection: 1000 V; input signal is < 20,000,000 V × Hz (product of voltage and frequency).
2. The frequency measurement is susceptible to error when measuring low-voltage, low-frequency signals. Shielding inputs from external noise pickup is critical for minimizing measurement errors. Turning on the low pass filter may help you to filter out the noise and achieve a stable reading.

Duty cycle [3]

Mode	Range	Accuracy at full scale
DC coupling	99.99%	0.3 % per kHz + 0.3 %
AC coupling	99.99%	0.3 % per kHz + 0.3 %

3. Notes for duty cycle specifications:
   - The accuracy for duty cycle and pulse width measurements is based on a 3 V square wave input to the DC 3 V range. For AC couplings, the duty cycle range can be measured within the range of 10% to 90% for signal frequencies > 20 Hz.
   - The range of the duty cycle is determined by the frequency of the signal: {10 µs × frequency × 100%} to {[1 – (10 µs × frequency)] × 100%}.
   - The pulse width (positive or negative) must be > 10 µs. The range of the pulse width is determined by the frequency of the signal.

Pulse width [4]

Range	Resolution	Accuracy at full scale
999.99 ms	0.01 ms	(duty cycle accuracy/frequency) + 0.01 ms
2000.0 ms	0.1 ms	(duty cycle accuracy/frequency) + 0.1 ms

4. Notes for pulse width specifications:
   - The accuracy for duty cycle and pulse width measurements is based on a 3 V square wave input to the DC 3 V range.
   - The pulse width (positive or negative) must be > 10 µs. The range of the pulse width is determined by the frequency of the signal.
